

## PUPPY INSTRUCTIONS

1. Your puppy will need 2 more puppy shots. Space them 3 to 4 weeks apart.
2. Your puppy will need a rabies shot around 20 weeks
3. Your puppy will need wormed **every month** with simple puppy wormer until at least 6 months. You can purchase this at Walmart or Tractor Supply. One worming should include the medicine that kills tapeworms, roundworms and hookworm. I use Sentry Worm X Plus (just use this product at 6 months) which I buy at Tractor Supply. When worming your puppy make sure to follow the directions and worm for your puppy's proper weight.
4. I feed my puppies "Purina Puppy Chow." At this age they are fed a small handful 3 times per day. If they're hesitant to eat try soaking it in warm water. If you switch them over to a holistic food wait at least 2 wks then do slowly.
5. Please keep your puppy comfortable and stress free for the first few days. Moving to their new home is hard on their immune system. Shots and wormings also depress their immune system so be sure to keep your puppy stress free on the days he or she is wormed or given shots.
6. Now enjoy your puppy and I'll see you back in a year or two. Most families that get a little doxie from me need to have another!! My puppies are the most loving, sweetest little puppies in the world.

Going Home: Your puppy is use to being with its' siblings. He or she is going to be rather scared and nervous going to their new home. Some puppies cry up a storm the first couple of nights but then they adjust to their new surroundings. Some families have been successful by putting a small crate on a chair next to their bed so that the puppy can still see them. The minute a puppy wakes up they **WILL** pee. You must always get your puppy outside the second they wake up. It works nice to have a section of newspaper on the lawn where you'd like your puppy to go. Put rocks on either end to keep it there. When you're puppy makes a mistake in the house clean it up with enzyme killer but take that dirty paper towel and smear it on the newspaper outside to put the odor there.

In the beginning do not leave water down 24/7. Some puppies will over drink and you'll never get control of their peeing. Feed them 3 then 2 times a day in very small amounts. ALWAYS have water down for them for at least ½ hour during feeding time. Then pick it up until the next feeding. Always put your puppy outside to go right after eating. They WILL need to poop very soon! FLEA CONTROL: While your puppy is too young for flea control products and medicines here's what to do: Dip a flea comb in a glass of rubbing alcohol or Dawn dish soap in water, then comb through the puppy's coat. Dip frequently and don't miss any places on the puppy.

**BEST WISHES FOR BOTH YOUR FAMILY AND MY LITTLE BABY!PS: Please contact me FIRST if some unforeseen situation comes up that you need to re-home your puppy. I WILL assist you in doing so. Thank you!**
